## Industrial Energy Management Training Course

### Table of Contents

- Course Learning Objectives ........................................................................................................... iv
- Foreword to Training Providers ....................................................................................................... v

### Module 1: Introduction to Industrial Energy Management

1.1 A Context for Industrial Energy Management in South Africa .............................................. 1
   1.1.1 A definition of energy management ..................................................................................... 1
   1.1.2 Motivation to manage energy ............................................................................................... 2
   1.1.3 Government Action on Industrial Energy Management ...................................................... 3
   1.1.4 Energy Supply Issues in South Africa .................................................................................... 4
1.2 Energy is a Manageable Expense ............................................................................................... 4
1.3 The Dimensions of Energy Management ................................................................................... 5
1.4 This Course .................................................................................................................................. 6

### Module 2: A Strategic Approach to Energy Management

2.1 Understanding Organisational Change ...................................................................................... 1
   2.1.1 Changing the organisation .................................................................................................. 2
   2.1.2 Corporate Culture ................................................................................................................. 2
2.2 Characteristics of Energy Managing Organisations ................................................................. 5
2.3 A Strategic Approach to Energy Management ........................................................................... 6
   2.3.1 Three Critical Elements ....................................................................................................... 6
   2.3.2 A Strategic Approach ............................................................................................................ 6
   2.3.3 Gain Control .......................................................................................................................... 7
   2.3.4 Invest .................................................................................................................................... 8
   2.3.5 Maintain Control .................................................................................................................... 8
   2.3.6 An ongoing process ............................................................................................................... 9

### Module 3: Assessing the Organisation

3.1 Assessing your Organisation – The Energy Management Matrix ............................................ 1
   3.1.1 How to use the matrix ......................................................................................................... 1
   3.1.2 Description of the matrix ..................................................................................................... 2
3.2 Action Planning .......................................................................................................................... 9

### Module 4: Developing an Energy Policy

4.1 A Rationale for the Energy Policy ............................................................................................. 1
   4.1.1 Purpose .................................................................................................................................. 2
   4.1.2 Energy policies in perspective ............................................................................................... 2
4.2 Developing the Energy Policy ..................................................................................................... 3
   4.2.1 The Elements of an Effective Energy Policy ....................................................................... 3
   4.2.2 Goals, Objectives and Targets ............................................................................................. 3
   4.2.3 Sample energy policy contents ............................................................................................ 5
   4.2.4 Devising the policy ............................................................................................................... 6
   4.2.5 Ratifying the policy ................................................................................................................. 6
   4.2.6 Monitoring Performance ....................................................................................................... 7

### Module 5: Organisational Structure for Energy Management

5.1 Organising for Energy Management ......................................................................................... 1
5.2 Location of energy management leadership ............................................................................... 2
5.3 Top management support ......................................................................................................... 3
5.4 Roles and Responsibilities .......................................................................................................... 3
5.5 Accountability .............................................................................................................................. 4
   5.5.1 Energy accountability centres ............................................................................................... 5
### Module 6: Training and Communicating for Energy Management

6.1 Working Definitions of Training and Communications ........................................... 1
6.2 Communications Initiatives ....................................................................................... 2
6.2.1 Selling .................................................................................................................. 2
6.2.2 Internal relations .................................................................................................. 3
6.2.3 External public relations ....................................................................................... 3
6.2.4 Types of Communication Initiatives .................................................................... 3
6.3 Training ..................................................................................................................... 4
6.3.1 Types of Training .................................................................................................. 4
6.3.2 Motivating Personnel .......................................................................................... 5
6.4 Planning for training and communication initiatives ................................................. 7
6.4.1 How much should you spend on training and communicating? ......................... 8
6.4.2 How can you keep up the momentum? ............................................................... 9

### Module 7: Energy Monitoring, Targeting & Reporting

7.1 A Rationale for Monitoring, Targeting and Reporting (MT&R) ................................ 1
7.2 The Scope and Information Sources for MT&R ....................................................... 4
7.3 Definitions ................................................................................................................. 4
7.4 Data and information ............................................................................................... 5
7.4.1 Information Needs for MT&R ........................................................................... 6
7.4.2 Interpreting Energy Consumption Data .............................................................. 6
7.5 Application: Establishing the Energy Relationship ................................................ 7
7.5.1 Energy and production – a theoretical basis ...................................................... 7
7.5.2 Finding the energy performance model ............................................................. 7
7.6 CUSUM ..................................................................................................................... 12
7.7 Summary: Regression and CUSUM ..................................................................... 15
7.8 The Control Chart ................................................................................................... 15
7.9 Targeting .................................................................................................................. 19
7.9.1 Performance Benchmarks .................................................................................. 19
7.9.2 Preliminary Targets ........................................................................................... 20
7.9.3 Revision of Targets ............................................................................................ 20
7.9.4 Target Setting and Performance Variability ....................................................... 21
7.10 Reporting ............................................................................................................... 23
7.10.1 Report Examples .............................................................................................. 25
7.11 Measurement and Verification: Formalized Monitoring and Targeting for Energy ... 25
7.11.1 Working Definitions ......................................................................................... 27
7.11.2 M&V Protocols ................................................................................................. 28
7.11.3 Why Measure & Verify? ................................................................................. 29
7.11.4 General Approach to M&V – The IPMVP ....................................................... 29
7.11.5 A Quantitative Basis for M&V ....................................................................... 32

### Module 8: Developing the Business Case

8.1 Introduction .............................................................................................................. 1
8.2 Building the Business Case ...................................................................................... 2
8.3 Assessing the baseline situation ............................................................................ 2
8.4 Identifying and Prioritising Opportunities ............................................................... 3
8.4.1 Setting priorities .............................................................................................. 3
8.5 How to Analyse the Investment ............................................................................. 4
8.5.1 Investment criteria ............................................................................................ 4
8.5.2 Simple Payback Period (SPP) .......................................................................... 5
8.5.3 Cash Flows ......................................................................................................... 6
8.5.4 Return on Investment (ROI) ............................................................................ 7
8.5.5 Life Cycle Costing – Net Present Value and Internal Rate of Return .............. 7
8.5.6 Risk and Sensitivity Analysis ............................................................................ 9
8.6 Financing of Energy Management ......................................................................... 10
8.6.1 Key decisions .................................................................................................... 10
8.6.2 Internal financing options ................................................................................ 11
8.6.3 External Financing Options ............................................................................. 11
8.7 Energy performance contracts and ESCOs ......................................................... 12
Module 9: 7 Steps for Energy Management

9.1 Managing Energy Costs ................................................................. 1

9.2 Overview of The 7 Steps ............................................................... 1

9.2.1 Understand Your Present Usage ............................................. 1

9.2.2 Identify Savings Opportunities ................................................. 3

9.3 Step 1: Understand your Energy Costs ......................................... 4

9.3.1 Electricity Metering ................................................................. 4

9.3.2 The Electricity Bill ................................................................. 4

9.3.3 Understanding How You Are Billed - The Tariff ....................... 5

9.3.4 Incremental Cost of Electricity ............................................... 6

9.3.5 Sources of Thermal Energy .................................................... 6

9.4 Water Consumption .................................................................. 8

9.5 Step 2: Compare Yourself ............................................................ 8

9.5.1 Tabulation of Electricity Data ................................................. 9

9.5.2 Tabulation of Fuel Consumption Data .................................... 10

9.5.3 Tabulation of Other Data ....................................................... 11

9.5.4 Analysis of Data ................................................................. 11

9.6 Step 3: Understand When Energy is Used ................................... 12

9.6.1 The Demand Profile ............................................................. 12

9.6.2 Analyzing the Demand Profile .............................................. 14

9.6.3 Obtaining a Demand Profile ................................................. 15

9.6.4 Opportunities for Savings in the Demand Profile ..................... 15

9.7 Step 4: Understand Where Energy is Used .................................. 16

9.8 Identify Savings Opportunities: A Critical Assessment .................. 22

9.8.1 A Critical Assessment .......................................................... 23

9.8.2 Benefits of Energy Inventories ............................................... 22

9.9 Step 5: Match Usage to Requirement ......................................... 23

9.10 Step 6: Maximize System Efficiencies ..................................... 24

9.11 Step 7: Optimize the Energy Supply ........................................ 24

9.12 Assessing the Benefit ............................................................. 25

9.12.1 Assessment of Disadvantages Associated with Savings Opportunities ... 25

9.12.2 Savings .............................................................................. 26

9.12.3 Costs ................................................................................. 27

9.12.4 Environmental Impact .......................................................... 27

9.13 Summary .................................................................................. 28

9.13.1 How Do We Begin? ............................................................... 28

Course Slides

Unit Standards
Course Learning Objectives

After completing this course, you will be able to:

♦ Relate industrial energy management to market conditions, industrial needs, and government programmes in South Africa;
♦ Provide strategic leadership for the implementation of energy management in light of the “culture” of your organisation;
♦ Assess the current capacity of your organisation to do energy management, and plan actions that focus on management practices to increase that capacity;
♦ Provide leadership for the development and implementation of energy-related policy, organisational development, training, communications, information management;
♦ Assess the financial merits of proposed energy management measures, and present the business case in support of implementation recommendations;
♦ Provide leadership for the in-house assessment of energy use and identification of savings opportunities.
Foreword to Training Providers

This course is designed to be a very practical, hands-on treatment of the management aspects of energy management. In addition to developing an understanding of the issues, it is intended to begin the actual planning process. To support these activities, the Guidebook includes a number of planning templates and other tools; the delivery agenda should provide sufficient time for participants to use and discuss these tools.

In addition to the planning templates, other tools that should be used include:
- The energy management matrix
- The energy impact self-assessment
- The TC³A (training and communication) matrix.

Because the course outcomes essentially involve increased organisational capacity for energy management, it is especially beneficial if more than one person from a given organisation attend as a group. For example, an individual from plant operations, another from maintenance and/or engineering, and another from finance would constitute an effective team. The common understanding of the issues arising from the course will help to bridge any gaps that might exist within the organisation regarding the importance and practicality of energy management.

Finally, an important function played by the training provider is the planning of the course agenda and the emphasis given to each of the topics. For example, an audience that is knowledgeable in financial analysis may not require an extensive treatment of Module 8, at least those parts that pertain to investment analysis techniques such as simple payback, NPV and IRR. Of course, the converse is also true.

As a final piece of advice to the training provider, the content in this course can be very “dry” or considerably engaging. The key to achieving the latter and avoiding the former is to deliver the course not as a lecture, but as an interactive discussion and planning activity. The relevance of the course will also be enhanced with the inclusion of local cases and examples to illustrate the key learning points. For example, in Module 4 on Energy Policy, examples from UK companies have been included, but it would be more valuable if examples from South African companies were provided.

This curriculum in the various forms that it has been provided in various parts of the world has quite consistently been met with very positive reactions, and has led to positive impacts on the participating organisations. It is our hope that the same experience will be encountered in South Africa.
